anyone who has looked through binoculars a telescope or microscope has used an eyepiece telescope eyepieces optical theory and design explores the wide range of eyepiece designs it introduces optics theory progressively to build understanding of how lenses control light in an optical system both generally and in eyepieces specifically linking optics fundamentals design evolution and the implications for image quality this book presents a logical narrative starting with snell s law of refraction at a flat surface progressing to paraxial and real rays at spherical and aspherical surfaces lenses and thin lens systems it demystifies the origin of aberrations by considering wavefront deviations all brought to life in the context of the familiar eyepiece principles are explored both descriptively and mathematically and carefully interpreted so the reader is not swamped by a sea of equations this book contains many diagrams of ray tracing results to illustrate optical principles and the consequences of design choices enabling the reader to visualise their impact on image quality and to cut through the puffery that is sometimes found

in the marketing of telescope eyepieces it bridges the gap between introductory books and expert level optical design texts written jointly for an astronomy readership and for physics and optical design students key features develops an understanding of optics by focusing on the design variations of a particular multi lens system the eyepiece which readers will have used when looking through binoculars telescopes and microscopes combines descriptions and interpretations of theory with many illustrative visualisations of eyepiece designs to help the reader develop an intuitive understanding of optics and aberrations in the familiar context of eyepieces written by a professor of astrophysics with experience as both an amateur and professional observer using telescopes at observatories around the world

this newly revised and updated edition offers a current and complete introduction to the analysis and design of electro optical eo imaging systems the third edition provides numerous updates and several new chapters including those covering pilotage infrared search and track and simplified target acquisition model the principles and components of the linear shift invariant lsi infrared and electro optical systems are detailed in full and help you to combine this approach with calculus and domain transformations to achieve a successful imaging system analysis ultimately the steps described in this book lead to results in quantitative characterizations of performance metrics such as modulation transfer functions minimum resolvable temperature difference minimum resolvable contrast and probability of object discrimination the book includes an introduction to two dimensional functions and mathematics which can be used to describe image transfer characteristics and imaging system components you also learn diffraction concepts of coherent and incoherent imaging systems which show you the fundamental limits of their performance by using the evaluation procedures contained in this desktop reference you become capable of predicting both sensor test and field performance and quantifying the effects of component variations the book contains over 800 time saving equations and includes numerous analyses and designs throughout it also includes a reference link to special website prepared by the authors that augments the book in the classroom and serves as an additional resource for practicing engineers with its comprehensive coverage and practical approach this is a strong resource for engineers needing a bench reference for sensor and basic scenario performance calculations numerous analyses and designs are given throughout the text it is also an excellent text for upper level students with an interest in electronic imaging systems

over the past year we have worked on the development of a real time laser based non intrusive field deployable detection system for delineation of moving vehicles the primary goal of the project is to develop a roadway detection system that can be used to gather reliable travel time data non intrusively microprocessor is used to control digital controlled potentiometer dcp which adjusts the gain of sensors signals it adjusts the system quickly on highway with only pushing a

button the adjustment which used to take half or an hour needs only several seconds meantime the microprocessor is also able to filter noise after having finished the task of adjustment the software of the system is rebuilt for 8 channels which used to be for 4 channels to be able to obtain more information of vehicles even like the outline of vehicle in order to improve the precision of the system we improved the mechanical design optical design and electric circuit design the frequency of laser pulse is 10 khz and the sample rate of computer dio96 board is also 10 khz this document describes the design and implementation of each functional component of the field deployment system the configuration of the field detection system and software design and implementation this report also discusses optical techniques that may potentially be used for the detection of trace amounts of gases such as co co2 no and no2 through the use of an overhead detector that employs signal reflection from a roadway like the laser based detection system these gas species are relevant to detection of highly polluting vehicles
