the 8th international conference on physical modelling in geotechnics icpmg2014 was organised by the centre for offshore foundation systems at the university of western australia under the auspices of the technical committee 104 for physical modelling in geotechnics of the international society of soil mechanics and geotechnical engineering this quadrennial conference is the traditional focal point for the physical modelling community of academics scientists and engineers to present and exchange the latest developments on a wide range of physical modelling aspects associated with geotechnical engineering these proceedings together with the seven previous proceedings dating from 1988 present an inestimable collection of the technical and scientific developments and breakthroughs established over the last 25 years

these proceedings include 10 keynote lectures from scientific leaders within the physical modelling community and 160 peer reviewed papers from 26 countries they are organised in 14 themes presenting the latest developments in physical modelling technology modelling techniques and sensors through a wide range of soil structure interaction problems including shallow and deep foundations offshore geotechnics dams and embankments excavations and retaining structures and slope stability fundamental aspects of earthquake engineering geohazards ground reinforcements and improvements and soil properties and behaviour are also covered demonstrating the increasing complexity of modelling arising from state of the art technological developments and increased understanding of similitude principles a special theme on education presents the latest developments in the use of physical modelling techniques for instructing undergraduate and postgraduate students in geotechnical engineering

inelastic buckling is the most important failure mode of a steel beam column element subjected to compression force in order to correctly predict this phenomenon large rotations large displacements and the plasticity of the section along the element must be considered several formulations have been proposed to model problems with three dimensional large displacements and rigid body dynamics they are usually based in the lagrangian or the corotational methods and are primarily oriented to solve mechanical and aerospace problems although some applications to structural stability do exist independently several formulations have been developed to model plasticity fiber elements plastic flow theory and lumped plasticity are popular choices in this dissertation a novel formulation capable of solving problems with displacement and material nonlinearities in a unified way is developed thus the state space approach is selected because all the basic equations of structures equilibrium compatibility and plasticity are solved simultaneously and thus the

global and local states are mutually and explicitly dependent to incorporate geometric nonlinearities the corotational approach where rigid body motion and deformations are described separately is adopted to incorporate material nonlinearities the formulation developed by simeonov 1999 and sivaselvan 2003 is included in general the set of equilibrium compatibility and plasticity equations constitute a system of differential algebraic equations dae a procedure to solve such system exists and is implemented in the package ida implicit differential algebraic solver developed at the lawrence livermore national laboratory llnl which is used to solve the problem numerically an experimental study on zipper frames was conducted to assess the accuracy of the proposed formulation a zipper frame is a chevron braced frame where the beam to brace connections are linked through columns called zipper columns the failure mode of a zipper frame is the successive inelastic buckling of its braces three shake table tests of a three stories zipper frame were performed at the ub nees laboratory a model of the first story of the zipper frame was analyzed with the new formulation and its results compared to experimental data it is found that the new formulation can reproduce the features of the test and it is very sensitive to all the model parameters results are presented

forty four chapters by educational and psychiatric experts examine important challenges and developments in gifted education the book discusses a variety of curriculum and instructional models that foster academic and creative growth including acceleration and enrichment programs it also explores
