electrodynamics is a basic area of physics encompassing also classical and quantum physics optics relativity and field theory and is of universal practical importance the present text aims at a balance between basic theory and practical applications and includes introductions to specific quantum mechanical effects the detailed presentation allows the reader to follow every step each chapter is supplemented by both worked examples and unsolved exercises this thoroughly revised second edition with new sections on networks and diffraction and with international units stated wherever relevant covers all the material normally required for a first degree in physics and beyond and may serve as a step to advanced applications and research

the book gives a general introduction to classical theoretical physics in the fields of mechanics relativity and electromagnetism it is analytical in approach and detailed in the derivations of physical consequences from the fundamental principles in each of the fields this second edition has a new part namely classical field theory highlighting a close connection between this part and earlier parts of the book where particles rather than fields are the center of attention as a general introduction to classical theoretical physics the book is different from most textbooks at this level which focus either on classical mechanics or classical electrodynamics but not both the book will in particular be useful as a textbook for physics courses with such a broader approach to classical physics for a wider group of students the book may be of interest for self study the new inclusion on classical field theory will give students greater understanding on previous parts of the book such as examining the lagrangian formulation of maxwell s equations with noether s theorem this is central in the use of lagrangian on fields as also discussed the text is illustrated with many figures most of these in color there are many useful examples and exercises which complement the derivations in the text

since maxwell s time electromagnetic theory has made spectacular progress particularly in the field of waves introduction to classical electrodynamics 2 presents the fundamental concepts of electromagnetic field theory this book first addresses static potentials with sources and provides a detailed presentation of the method of images and green s functions it also analyzes electromagnetic induction phenomena and maxwell s equations it examines electromagnetic waves in a vacuum and their properties as well as the concept of electromagnetic energy finally it covers polarized and magnetized media along with electromagnetic fields and their propagation in material media this book is intended for physics and mathematics students as well as engineering students interested in the challenges of electromagnetic theory the discussion is supplemented with numerous applications derived from the theoretical concepts presented

this book provides a concise and coherent introduction to the physics of particle accelerators with attention being paid to the design of an accelerator for use as an experimental tool in the second edition new chapters on spin dynamics of polarized beams as well as instrumentation and measurements are included with a discussion of frequency spectra and schottky signals the additional material also

covers quadratic lie groups and integration highlighting new techniques using cayley transforms detailed estimation of collider luminosities and new problems

designed for upper division electro magnetism courses or as a reference for electrical engineers scientists this is an introduction to maxwell s equations electromagnetic waves further discusses electrostatics magnetostatics induction etc in the light of those equations discussion of vector field theory included

this is the second volume of a two volume set presenting a unified approach to the electrodynamics of continua based on the principles of contemporary continuum of physics the first volume was devoted mainly to the development of the theory and applications to deformable solid media this volume extends the developments of the first volume to richer and newer grounds it contains discussions on fluid media magnetohydrodynamics eletrohydrodynamics and media with more complicated structures with the discussion in the last two chapters of memory dependent materials and non local e m theory the authors account for the nonlocal effects arising from motions and fields of material points at past times and at spatially distant points this discussion is included here to stimulate further research in these important fields which are presently in development stages the second volume is self contained and can be studied without the help of volume i a section summarizing the constitutive equations and the underlying physical ideas which were presented in more detail in the first volume is included this volume may be used as a basis for several graduate courses in engineering schools applied mathematics and physics departments it also contains fresh ideas and will stimulate further research in the directions the authors outline

this book provides a thorough description of classical electromagnetic radiation starting from maxwell s equations and moving on to show how fundamental concepts are applied in a wide variety of examples from areas such as classical optics antenna analysis and electromagnetic scattering throughout the author interweaves theoretical and experimental results to help give insight into the physical and historical foundations of the subject a key feature of the book is that pulsed and time harmonic signals are presented on an equal footing mathematical and physical explanations are enhanced by a wealth of illustrations over 300 and the book includes more than 140 problems it can be used as a textbook for advanced undergraduate and graduate courses in electrical engineering and physics and will also be of interest to scientists and engineers working in applied electromagnetics a solutions manual is available on request for lecturers adopting the text

this invaluable text has been developed to provide students with more background on the applications of electricity and magnetism particularly with those topics which relate to current research for example waveguides both metal and dielectric are discussed more thoroughly than in most texts because they are an important laboratory tool and important components of modern communications in a sense

this book modernizes the topics covered in the typical course on electricity and magnetism it provides not only solid background for the student who chooses a field which uses techniques requiring knowledge of electricity and magnetism but also general background for the physics major

theoretical computational and experimental electromagnetic modeling and characterization this engineering and scientific handbook offers extensive coverage of electromagnetic modeling and characterization of composite materials from the theoretical computational and experimental points of view you will get unique data for non conducting dielectrics semiconducting conducting and magnetic materials and composites composed of two or more molecularly distinct compounds the goal of the book is to contribute to current and visionary electromagnetic composite applications and extend the existing database for composites electromagnetic composites handbook models measurement and characterization is presented in a clear hierarchical style progressing from basic concepts through simple and more complex models and finally to data verifying the models provides a large collection of tabulated data for more than 300 complex composite materials information presented will aid in the development of multifunctional material designs the data is a direct extension from arthur von hippel s landmark dielectric materials and application

classical electromagnetism features a friendly informal writing style the text has received numerous accolades

this book presents maxwell s equations and the laws of classical electromagnetism starting from the equations for the electric and magnetic fields due to an accelerating classical point charge a microscopic perspective is used to interpret the electric field due to a current element the origin of induced electromagnetic fields and detached electric field lines motional electromagnetic fields the mode of action of inductors and capacitors in ac circuits conduction current flow the biot savart law etc a review of energy methods is presented in a way consistent with this microscopic approach leading up to discussions of the conservation laws for a system of spatially separated moving charges and the poynting vector hypothesis after extending maxwell s equations to field points inside dielectrics and magnetic materials a brief review of special relativity is given stressing those topics that illustrate the essential unity of classical electromagnetism and special relativity audience this textbook is designed to be used between a course in classical electromagnetism in which vector analysis has been introduced and an advanced graduate course in electromagnetism it will also be of interest to research physicists and to graduate students as a complement to more traditional courses

written by internationally recognized experts the high quality of the articles provides dependable information on topics of current interest in industrial and academic research as well as background knowledge covering both theoretical and applied optics each article has not only a

list of references cited in the text but also a guide to further reading each article also concludes with a glossary containing the technical terms necessary for the topic under consideration throughout the subject matter is treated in a tutorial user friendly way rather than as a pure reference and is supplemented by references cited in the text and a listing of important reviews and books

this text advances from the basic laws of electricity and magnetism to classical electromagnetism in a quantum world the treatment focuses on core concepts and related aspects of math and physics 2016 edition
