the seven articles in this special issue represent a sampling of the exciting findings that are beginning to emerge from studies of executive control in young children they demonstrate the multidisciplinary approaches to study cognition in young children that include application of cognitive neuroscience and developmental paradigms in typically developing youngsters as well as those affected by clinical conditions such as traumatic brain injury exposure to low levels of lead in the environment and prematurity although much work remains to be done these study results are illustrative of the dynamic work in this exciting development period

the graphical user interface gui as the most prevailing type of user interface ui in today s interactive applications restricts the interaction with a computer to the visual modality and is therefore not suited for some users e g with limited literacy or typing skills in some circumstances e g while moving around with their hands or eyes busy or when the environment is constrained e g the keyboard and the mouse are not available in order to go beyond the gui constraints the multimodal mm uis appear as paradigm that provide users with great expressive power naturalness and flexibility in this thesis we argue that developing mm uis combining graphical and vocal modalities is an activity that could benefit from the application of a methodology which is composed of a set of models a method manipulating these models and the tools implementing the method therefore we define a design space based method that is supported by model to model colored transformations in order to obtain mm uis of information systems the design space is composed of explicitly defined design options that clarify the development process

in a structured way in order to require less design effort the feasibility of the methodology is demonstrated through three case studies with different levels of complexity and coverage in addition an empirical study is conducted with end users in order to measure the relative usability level provided by different design decisions

lifestyle and social structure concepts definitions analyses is devoted the relationship between lifestyle and social structure the book begins by constructing a meaningful concept of lifestyle in order to understand and model this relationship the general formulation of the concept hinges on the descriptive word style defined as any distinctive and therefore recognizable way in which an act is performed or an artifact made or ought to be performed and made after developing the implications of the definition lifestyle is defined by analogy as any distinctive and therefore recognizable mode of living the notion of social structure is then introduced arguing that structural differentiation engenders lifestyle differentiation the remainder of the work is concerned primarily with the modeling of this relationship using data from the 1972 1973 survey of consumer expenditures and with the concept of stylistic unity key topics discussed include the relationship between the theory of lifestyle differentiation and modern economic utility theory psychographic notions of lifestyle and the relationships between lifestyle and other key sociological concepts stratification alienation the concept of lifestyle should be of interest to a broad range of applied and theoretical researchers

worker redundancy has become a widespread social phenomenon in industrialised countries over the past 50 years originally published in 1987 this book based on extensive original research examines the nature of redundancy and its effects it focuses in particular on the process of redundancy itself on the complex relationship between redundancy situations and the labour market on the impact of redundancy on the quality of life of those affected and on the relationship between redundancy and issues of race gender and politics it draws on material from the united states britain and western europe

across the social sciences there has been increasing focus on reproducibility i e the ability to examine a study s data and methods to ensure accuracy by reproducing the study reproducible econometrics using r combines an overview of key issues and methods with an introduction to how to use them using open source software r and recently developed tools r markdown and bookdown that allow the reader to engage in reproducible econometric research jeffrey s racine provides a step by step approach and covers five sets of topics i linear time series models ii robust inference iii robust estimation iv model uncertainty and v advanced topics the time series material highlights the difference between time series analysis which focuses on forecasting versus cross sectional analysis where the focus is typically on model parameters that have economic interpretations for the time series material the reader begins with a discussion of random walks white noise and non stationarity the reader is next exposed to the pitfalls of using standard inferential procedures that are popular in cross sectional settings when modelling time series data and is introduced to alternative procedures that form the basis for linear time series analysis for the robust inference material the reader is introduced to the potential advantages of bootstrapping and the jackknifing versus the use of asymptotic theory and a range of numerical approaches are presented for the robust estimation material the reader is presented with a discussion of issues surrounding outliers in data and methods for addressing their presence finally the model uncertainty material outlines two dominant approaches for dealing with model uncertainty namely model selection and model averaging throughout the book there is an emphasis on the benefits of using r and other open source tools for ensuring reproducibility the advanced material covers machine learning methods support vector machines that are useful for classification and nonparametric kernel regression which provides the reader with more advanced methods for confronting model uncertainty the book is well suited for advanced undergraduate and graduate students alike assignments exams slides and a solution manual are available for instructors

this study examines the sensitivity of surface layer windflow over gently rolling terrain to different stability conditions both with and without the effects of vegetation used to modify terrain heights and determine surface roughness the numerical model used produces simulations of surface layer windflow by using gauss s principle of least constraints to allow an initially uniform windfield to adjust to topography and buoyancy forces while conserving mass the model experiments used simulated meteorological data at only one observation point and detailed terrain and vegetation data on a 51 by 51 grid with 100 m spacing for an area covering 5 by 5 km over the fort polk military reservation in

louisiana results show that the model simulates topographically induced flows such as cold air drainage and upslope flow despite the simple physics employed we also show that the presence to tall vegetation over the area mainly coniferous and deciduous trees alters the flow patterns under various stability conditions these effects are shown to be caused primarily by changes in the area of chemical transport and diffusion because they mean that even gently rolling terrain influences the surface windflow and that tall vegetation has a considerable influence as well
