the complexity of most real time and embedded systems often exceeds that of other types of systems since in addition to the usual spectrum of problems inherent in software they need to deal with the complexities of the physical world that world as the proverbial mr murphy tells us is an unpredictable and often unfriendly place consequently there is a very strong motivation to investigate and apply advanced design methods and technologies that could simplify and improve the reliability of real time software design and implementation as a result from the first versions of uml issued in the mid 1990 s designers of embedded and real time systems have taken to uml with vigour and enthusiasm however the dream of a complete model driven design flow from specification through automated optimised code generation has been difficult to realise without some key improvements in uml semantics and syntax specifically targeted to the real time systems problem with the enhancements in uml that have been proposed and are near standardisation with uml 2 0 many of these improvements have been made in the spring of 2003 adoption of a formalised uml 2 0 specification by the members of the object management group omg seems very close it is therefore very appropriate to review the status of uml as a set of notations for embedded real time systems both the state of the art and best practices achieved up to this time with uml of previous generations and where the changes embodied in the 2
