this book introduces new concepts for cooperative game theory and particularly solutions that determine the distribution of a coalitional surplus among the members of the coalition it also addresses several generalizations of cooperative game theory drawing on methods of welfare economics new value solutions are derived for non transferable utility games with and without differences of bargaining power among the members of the coalition cooperation in intertemporal games is examined and conditions that permit the reduction of these games to games in coalition function form are outlined biform games and games that combine non cooperative search and matching of coalition members with cooperative solutions i e efficient contracts within the coalition are considered

it is commonly believed that macroeconomic models are not useful for policy analysis because they do not take proper account of agents expectations over the last decade mainstream macroeconomic models in the uk and elsewhere have taken on board the rational expectations revolution by explicitly incorporating expectations of the future in principle one can perform the same technical exercises on a forward expectations model as on a conventional model and more rational expectations in macroeconomic models deals with the numerical methods necessary to carry out policy analysis and forecasting with these models these methods are often passed on by word of mouth or confined to obscure journals rational expectations in macroeconomic models brings them together with applications which are interesting in their own right there is no comparable textbook in the literature the specific subjects include i solving for model consistent expectations ii the choice of terminal condition and time horizon iii experimental design i e the effect of temporary vs permanent anticipated vs unanticipated shocks deterministic vs stochastic dynamic vs static simulation iv the role of exchange rate v optimal control and inflation output tradeoffs the models used are those of the liverpool research group in macroeconomics the london business school and the national institute of economic and social research

this paper considers the possibility that in linear rational expectations re models all determinate uniquely non explosive solutions coincide with the minimum state variable msv solution which is unique by construction in univariate specifications of the form $y_t = a + b_1 y_{t-1} + b_2 y_{t-2} + \dots + b_k y_{t-k} + u_t$ that result holds if a re solution is unique and non explosive then it is the same as the msv solution also this result holds for multivariate versions if the a and c matrices commute and a certain regularity condition holds more generally however there are models of this form that possess unique non explosive solutions that differ from their msv solutions examples are provided and a strategy for easily constructing others is outlined

metastable and nanocrystalline materials offer enormous technological potential and for this reason they are the subject of intense world wide research
