thinking algebraically presents the insights of abstract algebra in a welcoming and accessible way it succeeds in combining the advantages of rings first and groups first approaches while avoiding the disadvantages after an historical overview the first chapter studies familiar examples and elementary properties of groups and rings simultaneously to motivate the modern understanding of algebra the text builds intuition for abstract algebra starting from high school algebra in addition to the standard number systems polynomials vectors and matrices the first chapter introduces modular arithmetic and dihedral groups the second chapter builds on these basic examples and properties enabling students to learn structural ideas common to rings and groups isomorphism homomorphism and direct product the third chapter investigates introductory group theory later chapters delve more deeply into groups rings and fields including galois theory and they also introduce other topics such as lattices the exposition is clear and conversational throughout the book has numerous exercises in each section as well as supplemental exercises and projects for each chapter many examples and well over 100 figures provide support for learning short biographies introduce the mathematicians who proved many of the results the book presents a pathway to algebraic thinking in a semester

or year long algebra course

an episodic history of mathematics delivers a series of snapshots of the history of mathematics from ancient times to the twentieth century the intent is not to be an encyclopedic history of mathematics but to give the reader a sense of mathematical culture and history the book abounds with stories and personalities play a strong role the book will introduce readers to some of the genesis of mathematical ideas mathematical history is exciting and rewarding and is a significant slice of the intellectual pie a good education consists of learning different methods of discourse and certainly mathematics is one of the most well developed and important modes of discourse that we have the focus in this text is on getting involved with mathematics and solving problems every chapter ends with a detailed problem set that will provide the student with many avenues for exploration and many new entrees into the subject

this book explores several non traditional and under researched fields in islamic finance through its investigations into how the newly emergent financial instrument sukuk behaves in the broader field of finite period financing and pricing in the market place it provides readers with didactic information on the fundamental theories of term structure and in depth information on this nascent financial instrument in the islamic capital market the book employs one and two factor models of term structure in order to analyse sovereign and corporate sukuk bonds from the world s leading islamic economy malaysia for the purposes of the study the book establishes profit rate yield curves in the tradition of the conventional bond yield curve in order to define different risk classes of sukuk the dynamics of term structure of profit rates are captured with the inclusion of volatility as a factor in one of the models the book provides informative case studies for interested students and researchers in the field of financial economics and mathematical finance it also provides examples that will serve to simplify future research in term structure analysis and reduce its computational inefficiency

mathematics for secondary school teachers discusses topics of central importance in the secondary school mathematics curriculum including functions polynomials trigonometry exponential and logarithmic functions number and operation and measurement acknowledging diversity in the mathematical backgrounds of pre service teachers and in the goals of teacher preparation programs the authors have written a flexible text through which instructors can emphasize any of the following basics exploration of key pre college topics from intuitive and rigorous points of view connections exploration of relationships among topics using tools from college level mathematics extensions exploration of college level mathematical topics that have a compelling relationship to pre college mathematics mathematics for secondary school teachers provides a balance of discovery learning and direct instruction activities and exercises address the range of learning objectives appropriate for future teachers beyond the obvious goals of conceptual understanding and computational fluency readers are invited to devise mathematical explanations and arguments create examples and visual representations remediate typical student errors and misconceptions and analyze student work introductory discussion questions encourage prospective teachers to take stock of their knowledge of pre college topics a rich collection of exercises of widely varying degrees of difficulty is integrated with the text activities and exercises are easily adapted to the settings of individual assignments group projects and classroom discussions mathematics for secondary school teachers is primarily intended as the text for a bridge or capstone course for pre service secondary school mathematics teachers it can also be used in alternative licensure programs as a supplement to a mathematics methods course as the text for a graduate course for in service teachers and as a resource and reference for in service faculty development

this is a college algebra level textbook written to provide the kind of mathematical knowledge and experiences that students will need for courses in other fields such as biology chemistry business finance economics and other areas that are heavily dependent on data either from laboratory experiments or from other studies the focus is on the fundamental mathematical concepts and the realistic problem solving via mathematical modeling rather than the development of algebraic skills that might be needed in calculus functions data and models presents college algebra in a way that differs from almost all college algebra books available today rather than going over material covered in high school courses the gordons teach

something new students are given an introduction to data analysis and mathematical modeling presented at a level that students with limited algebraic skills can understand the book contains a rich set of exercises many of which use real data also included are thought experiments or what if questions that are meant to stretch the student's mathematical thinking

college calculus a one term course for students with previous calculus experience is a textbook for students who have successfully experienced an introductory calculus course in high school college calculus begins with a brief review of some of the content of the high school calculus course and proceeds to give students a thorough grounding in the remaining topics in single variable calculus including integration techniques applications of the definite integral separable and linear differential equations hyperbolic functions parametric equations and polar coordinates l'hôpital's rule and improper integrals continuous probability models and infinite series each chapter concludes with several explorations extended discovery investigations to supplement that chapter's material the text is ideal as the basis of a course focused on the needs of prospective majors in the stem disciplines science technology engineering and mathematics a one term course based on this text provides students with a solid foundation in single variable calculus and prepares them for the next course in college level mathematics be it multivariable calculus linear algebra a course in discrete mathematics statistics etc

this second edition expands the first chapters which focus on the approach to risk management issues discussed in the first edition to offer readers a better understanding of the risk management process and the relevant quantitative phases in the following chapters the book examines life insurance non life insurance and pension plans presenting the technical and financial aspects of risk transfers and insurance without the use of complex mathematical tools the book is written in a comprehensible style making it easily accessible to advanced undergraduate and graduate students in economics business and finance as well as undergraduate students in mathematics who intend starting on an actuarial qualification path with the systematic inclusion of practical topics professionals will find this text useful when working in insurance and pension related areas where investments risk analysis and financial reporting play a major role

a bridge to abstract mathematics will prepare the mathematical novice to explore the universe of abstract mathematics mathematics is a science that concerns theorems that must be proved within the constraints of a logical system of axioms and definitions rather than theories that must be tested revised and retested readers will learn how to read mathematics beyond popular computational calculus courses moreover readers will learn how to construct their own proofs the book is intended as the primary text for an introductory course in proving theorems as well as for self study or as a reference throughout the text some pieces usually proofs are left as exercises part v gives hints to help students find good approaches to the exercises part i introduces the language of mathematics and the methods of proof the mathematical content of parts ii through iv were chosen so as not to seriously overlap the standard mathematics major in part ii students study sets functions equivalence and order relations and cardinality part iii concerns algebra the goal is to prove that the real numbers form the unique up to isomorphism ordered field with the least upper bound in the process we construct the real numbers starting with the natural numbers students will be prepared for an abstract linear algebra or modern algebra course part iv studies analysis continuity and differentiation are considered in the context of time scales nonempty closed subsets of the real numbers students will be prepared for advanced calculus and general topology courses there is a lot of room for instructors to skip and choose topics from among those that are presented
