mathematics plays an important role in many scientific and engineering disciplines this book deals with the numerical solution of differential equations a very important branch of mathematics our aim is to give a practical and theoretical account of how to solve a

large variety of differential equations comprising ordinary differential equations initial value problems and boundary value problems differential algebraic equations partial differential equations and delay differential equations the solution of differential equations using  $r$  is the main focus of this book it is therefore intended for the practitioner the student and the scientist who wants to know how to use  $r$  for solving differential equations however it has been our goal that non mathematicians should at least understand the basics of the methods while obtaining entrance into the relevant literature that provides more mathematical background therefore each chapter that deals with  $r$  examples is preceded by a chapter where the theory behind the numerical methods being used is introduced in the sections that deal with the use of  $r$  for solving differential equations we have taken examples from a variety of disciplines including biology chemistry physics pharmacokinetics many examples are well known test examples used frequently in the field of numerical analysis

process modelling and model analysis describes the use of models in process engineering process engineering is all about manufacturing of just about anything to manage processing and manufacturing systematically the engineer has to bring together many different techniques and analyses of the interaction between various aspects of the process for example process engineers would apply models to perform feasibility analyses of novel process designs assess environmental impact and detect potential hazards or accidents to manage complex systems and enable process design the behavior of systems is reduced to simple mathematical forms this book provides a systematic approach to the mathematical development of process models and explains how to analyze those models additionally there is a comprehensive bibliography for further reading a question and answer section and an accompanying site developed by the authors with additional data and exercises introduces a structured modeling methodology emphasizing the importance of the modeling goal and including key steps such as model verification calibration and validation focuses on novel and advanced modeling techniques such as discrete hybrid hierarchical and empirical modeling illustrates the notions tools and techniques of process modeling with examples and advances applications

the schrodinger equation is the master equation of quantum chemistry the founders of quantum mechanics realised how this equation underpins essentially the whole of chemistry however they recognised that its exact application was much too complicated to be solvable at the time more than two generations of researchers were left to work out how to achieve this ambitious goal for molecular systems of ever increasing size this book focuses on non mainstream methods to solve the molecular electronic schrodinger equation each method is based on a set of core ideas and this volume aims to explain these ideas clearly so that they become more accessible by bringing together these non standard methods the book intends to inspire graduate students postdoctoral researchers and academics to think of novel approaches is there a method out there that we have not thought of yet can we design a new method that combines the best of all worlds
