practical goal programming is intended to allow academics and practitioners to be able to build effective goal programming models to detail the current state of the art and to lay the foundation for its future development and continued application to new and varied fields suitable as both a text and reference its nine chapters first provide a brief history fundamental definitions and underlying philosophies and then detail the goal programming variants and define them algebraically chapter 3 details the step by step formulation of the basic goal programming model and chapter 4 explores more advanced modeling issues and highlights some recently proposed extensions chapter 5 then details the solution methodologies of goal programming concentrating on computerized solution by the excel solver and lingo packages for each of the three main variants and includes a discussion of the viability of the use of specialized goal programming packages chapter 6 discusses the linkages between pareto efficiency and goal programming chapters 3 to 6 are supported by a set of ten exercises and an excel spreadsheet giving the basic solution of each example is available at an accompanying website chapter 7 details the current state of the art in terms of the integration of goal programming with other techniques and the text concludes with two case studies which were chosen to demonstrate the application of goal programming in practice and to illustrate the principles developed in chapters 1 to 7 chapter 8 details an application in healthcare and chapter 9 describes applications in portfolio selection

environmental engineers work to increase the level of health and happiness in the world by designing building and operating processes and systems for water treatment water pollution control air pollution control and solid waste management these projects compete for resources with projects in medicine transportation education and other fields that have a similar objective the challenge is to make the investments efficient to get the best project outputs with a minimum of inputs cost engineering for pollution prevention and control examines how to identify the best solution by judging alternatives with respect to some measure of system performance such as total capital cost annual cost annual net profit return on investment cost benefit ratio net present worth minimum production time maximum production rate minimum energy utilization and so on key features explains how to estimate preliminary costs how to compare the life cycle costs of alternative projects how to find the optimal balance between capital costs and operating costs emphasis is placed on formulating the problem rather than on the mathematical details of how the calculations are

done provides numerous practical examples and case studies includes end of chapter exercises dealing with water wastewater air pollution solid wastes and remediation projects the important concepts presented in this book can be understood by those students who have taken an introductory course in environmental engineering advanced knowledge of process design is not required the material can also be utilized by engineers managers and others who would benefit from a better understanding of how engineers look at problems
