in a relatively short span of time computers have evolved from huge mainframes to small and elegant desktop computers and now to low power ultra portable handheld devices with each passing generation computers consisting of processors memories and peripherals become smaller and faster for example the first commercial computer univac costed 1 million dollars occupied 943 cubic feet space and could perform 1 905 operations per second 94 now a processor present in an electric shaver easily outperforms the early mainframe computers the miniaturization is largely due to the efforts of engineers and scientists that made the expeditious progress in the microelectronic technologies possible according to moore s law 90 the advances in technology allow us to double the number of transistors on a single silicon chip every 18 months this has lead to an exponential increase in the number of transistors on a chip from 2 300 in an intel 4004 to 42 millions in intel itanium processor 55 moore s law has withstood for 40 years and is predicted to remain valid for at least another decade 91 not only the miniaturization and dramatic performance improvement but also the significant drop in the price of processors has lead to situation where they are being integrated into products such as cars televisions and phones which are not usually associated with computers this new trend has also been called the disappearing computer where the computer does not actually disappear but it is everywhere 85 digital devices containing processors now constitute a major part of our daily lives a small list of such devices includes microwave ovens television sets mobile phones digital cameras mp3

players and cars whenever a system comprises of information processing digital devices to control or to augment its functionality such a system is termed an embedded system therefore all the above listed devices can be also classified as embedded systems

signal processing plays an increasingly central role in the development of modern telecommunication and information processing systems with a wide range of applications in areas such as multimedia technology audio visual signal processing cellular mobile communication radar systems and financial data forecasting the theory and application of signal processing deals with the identification modelling and utilisation of patterns and structures in a signal process the observation signals are often distorted incomplete and noisy and hence noise reduction and the removal of channel distortion is an important part of a signal processing system advanced digital signal processing and noise reduction third edition provides a fully updated and structured presentation of the theory and applications of statistical signal processing and noise reduction methods noise is the eternal bane of communications engineers who are always striving to find new ways to improve the signal to noise ratio in communications systems and this resource will help them with this task features two new chapters on noise distortion and diversity in mobile environments and noise reduction methods for speech enhancement over noisy mobile devices topics discussed include probability theory bayesian estimation and classification hidden markov models adaptive filters multi band linear prediction spectral estimation and impulsive and transient noise removal explores practical solutions to interpolation of missing signals echo cancellation impulsive and transient noise removal channel equalisation hmm based signal and noise decomposition this is an invaluable text for senior undergraduates postgraduates and researchers in the fields of digital signal processing telecommunications and statistical data analysis it will also appeal to engineers in telecommunications and audio and signal processing industries

written to address technical concerns that mobile developers face regardless of the platform j2me wap windows ce etc this 2005 book explores the differences between mobile and stationary applications and the architectural and software development concepts needed to build a mobile application using uml as a tool reza b far guides the developer through the development process showing how to document the design and implementation of the application he focuses on general concepts while using platforms as examples or as possible tools after introducing uml xml and derivative tools necessary for developing mobile software applications b far shows how to build user interfaces for mobile applications he covers location sensitivity wireless connectivity mobile agents data synchronization security and push based technologies and finally homes in on the practical issues of mobile application development including the development cycle for mobile applications testing mobile applications architectural concerns and a case study
