document in the subject computer sciences artificial intelligence language english abstract in today scenario there is abrupt usage of microblogging sites such as twitter for sharing of feelings and emotions towards any current hot topic any product services or any event such opinionated data needs to be leveraged effectively to get valuable insight from that data this research work focused on designing a comprehensive feature based twitter sentiment analysis tsa framework using the supervised machine learning approach with integrated sophisticated negation handling approach and knowledge based tweet normalization system tns we generated three real time twitter datasets using search operators such as demonetization lockdown and 9pm9minutes and also used one publically available benchmark dataset semeval 2013 to assess the viability of our comprehensive feature based twitter sentiment analysis system on tweets we leveraged varieties of features such as lexicon based features pos based morphological ngrams negation and cluster based features to ascertain which classifier works well with which feature group we employed three state of the art classifiers including support vector machine svm decision tree classifier dtc and naive bayesian nb for our twitter sentiment

analysis framework we observed svm to be the best performing classifier across all the twitter datasets except 9pm9minutes dtc turned out to be the best for this dataset moreover our svm model trained on the semeval 2013 training dataset outperformed the winning team nrc canada of semeval 2013 task 2 in terms of macro averaged f1 score averaged on positive and negative classes only though state of the art twitter sentiment analysis systems reported significant performance it is still challenging to deal with some critical aspects such as negation and tweet normalization
