in recent years a new class of applications has come to the forefront p marily due to the  
advancement in our ability to collect data from multitudes of devices and process them e  
ciently these include homeland security plications sensor pervasive computing  
applications various kinds of mo toring applications and even traditional applications  
belonging to nancial computer network management and telecommunication domains  
these plications need to process data continuously and as long as data is available from  
one or more sources the sequence of data items continuously gen ated by sources is

termed a data stream because of the possible never ending nature of a data stream the amount of data to be processed is likely to be unbounded in addition timely detection of interesting changes or patterns or aggregations over incoming data is critical for many of these applications furthermore the data arrival rates may fluctuate over a period of time and may be bursty at times for most of these applications quality of service or qos requirements such as response time memory usage and throughput are extremely important these application requirements make it infeasible to simply load the incoming data streams into a persistent store and process them effectively using currently available database management techniques
