international relations ir theorists have ceaselessly sought to understand explain and transform the experienced reality of international politics running through all these attempts is a persistent yet unquestioned quest by theorists to develop strategies to eliminate or reduce the antinomies contradictions paradoxes dilemmas and inconsistencies dogging their approaches a serious critical assessment of the logic behind these strategies is however lacking this new work addresses this issue by seeking to reformulate ir theory in an original way arfi begins by providing a thorough critique of leading contemporary ir theories including pragmatism critical scientific realism rationalism neo liberal institutionalism and social constructivism and then moves on to strengthen and go beyond the valuable contributions of each approach by employing the logic of deconstruction pioneered by derrida to explicate the consequences of taking into account the dilemmas and inconsistencies of these theories the book demonstrates that the logic of deconstruction is resourceful and rigorous in its questioning of the presuppositions of prevailing ir approaches and argues that relying on deconstruction leads to richer and more powerfully insightful pluralist ir theories and is an invaluable resource for taking ir theory beyond currently paralyzing wars of paradigms questioning universally accepted presuppositions in existing theories this book provides an innovative and exciting contribution to the field and will be of great interest to scholars of international relations theory critical theory and international relations

this book gives a state of the art approach to the study of polynomial identities satisfied by a given algebra by combining methods of ring theory combinatorics and representation theory of groups with analysis the idea of applying analytical methods to the theory of polynomial identities appeared in the early 1970s and this approach has become one of the most powerful tools of the theory a pi algebra is any algebra satisfying at least one nontrivial polynomial identity this includes the polynomial rings in one or several variables the grassmann algebra finite dimensional algebras and many other algebras occurring naturally in mathematics the core of the book is the proof that the sequence of co dimensions of any pi algebra has integral exponential growth the pi exponent of the algebra later chapters further apply these results to subjects such as a characterization of varieties of algebras having polynomial growth and a classification of varieties that are minimal for a given exponent

during the past forty years a new trend in the theory of associative algebras lie algebras and their representations has formed under the influence of mathematical logic and universal algebra namely the theory of varieties and identities of associative

algebras lie algebras and their representations the last twenty years have seen the creation of the method of 2 words and alpha functions which allowed a number of problems in the theory of groups rings lie algebras and their representations to be solved in a unified way the possibilities of this method are far from exhausted this book sums up the applications of the method of 2 words and alpha functions in the theory of varieties and gives a systematic exposition of contemporary achievements in the theory of identities of algebras and their representations closely related to this method the aim is to make these topics accessible to a wider group of mathematicians

a polynomial identity for an algebra or a ring a π algebra is a polynomial in noncommutative variables that vanishes under any evaluation in a π algebra satisfying a nontrivial polynomial identity is called a π algebra and this is the main object of study in this book which can be used by graduate students and researchers alike the book is divided into four parts part 1 contains foundational material on representation theory and noncommutative algebra in addition to setting the stage for the rest of the book this part can be used for an introductory course in noncommutative algebra an expert reader may use part 1 as reference and start with the main topics in the remaining parts part 2 discusses the combinatorial aspects of the theory the growth theorem and shirshov's bases here methods of representation theory of the symmetric group play a major role part 3 contains the main body of structure theorems for π algebras theorems of kaplansky and posner the theory of central polynomials m artin's theorem on azumaya algebras and the geometric part on the variety of semisimple representations including the foundations of the theory of cayley hamilton algebras part 4 is devoted first to the proof of the theorem of razmyslov kemer and braun on the nilpotency of the nil radical for finitely generated π algebras over noetherian rings then to the theory of kemer and the specht problem finally the authors discuss π exponent and codimension growth this part uses some nontrivial analytic tools coming from probability theory the appendix presents the counterexamples of golod and shafarevich to the burnside problem
