a number of widely used contemporary processors have instruction set extensions for improved performance in multi media applications the aim is to allow operations to proceed on multiple pixels each clock cycle such instruction sets have been incorporated both in specialist dspchips such as the texas c62xx texas instruments 1998 and in general purpose cpu chips like the intel ia32 intel 2000 or the amd k6 advanced micro devices 1999 these instruction set extensions are typically based on the single instruction stream multiple data stream simd model in which a single instruction causes the same mathematical operation to be carried out on several operands or pairs of operands at the same time the level of parallelism supported ranges from two floating point operations at a time on the amd k6 architecture to 16 byte operations at a time on the intel p4 architecture whereas processor architectures are moving towards greater levels of parallelism the most widely used programming languages such as c java and delphi are structured around a model of computation in which operations take place on a single value at a time this was appropriate when processors worked this way but has become an impediment to programmers seeking to make use of the performance offered by multi media instruction sets the introduction of simd instruction sets peleg et al
