as the requirements for low power consumption and very small physical dimensions in portable wearable and implantable medical devices are calling for integrated circuit design techniques using mosfets operating in the subthreshold

regime this book first revisits some well known circuit techniques that use cmos devices biased in subthreshold in order to establish nanopower integrated circuit designs based on the these findings this book shows the development of a class ab current mode sample and hold circuit with an order of magnitude improvement in its figure of merit compared to other state of the art designs also the concepts and design procedures of 1 single branch filters 2 follower integrator based lowpass filters and 3 modular transconductance reduction techniques for very low frequency filters are presented finally to serve the requirement of a very large signal swing in an energy based action potential detector a nanopower class ab current mode analog multiplier is designed to handle input current amplitudes of more than 10 times the bias current of the multiplier circuit the invented filter circuits have been fabricated in a standard 0.18 μ cmos process in order to verify our circuit concepts and design procedures their experimental results are reported
