combining algebraic groups and number theory this volume gathers material from the representation theory of this group for the first time doing so for both local archimedean and non archimedean cases as well as for the global number field case

this book provides a conceptual introduction into the representation theory of local and global groups with final emphasis on automorphic representations of reductive groups g over number fields f our approach to automorphic representations differs from the usual literature we do not consider k finite automorphic forms but we allow a richer class of smooth functions of uniform moderate growth contrasting the usual approach our space of smooth automorphic forms is intrinsic to the group scheme g f this setup also covers the advantage that a perfect representation theoretical symmetry between the archimedean and non archimedean places of the number field f is regained by making the bigger space of smooth automorphic forms into a proper continuous representation of the full group of adelic points of g graduate students and researchers will find the covered topics appear for the first time in a book where the theory of smooth automorphic representations is robustly developed and presented in great detail
