in this book dr coolidge explains non euclidean geometry which consists of two geometries based on axioms closely related to those specifying euclidean geometry as euclidean geometry lies at the intersection of metric geometry and affine geometry non euclidean geometry arises when either the metric requirement is relaxed or the parallel postulate is replaced with an alternative one in the latter case one obtains hyperbolic geometry and elliptic geometry the traditional non euclidean geometries when the metric requirement is relaxed then there are affine planes associated with the planar algebras which give rise to kinematic geometries that have also been called non euclidean geometry the essential difference between the metric geometries is the nature of parallel lines euclid s fifth postulate the parallel postulate is equivalent to playfair s postulate which states that within a two dimensional plane for any given line l and a point a which is not on l there is exactly one line through a that does not intersect l in hyperbolic geometry by contrast there are infinitely many lines through a not intersecting l while in elliptic geometry any line through a intersects l another way to describe the differences between these geometries is to consider two straight lines indefinitely extended in a two dimensional plane that are both perpendicular to a third line in euclidean geometry the lines remain at a constant distance from each other meaning that a line drawn perpendicular to one line at any point will intersect the other line and the length of the line segment joining the points of intersection remains constant and are known as parallels in hyperbolic geometry they curve away from each other increasing in distance as one moves further from the points of intersection with the common perpendicular these lines are often called ultraparallels in elliptic geometry the lines curve toward each other and intersect

an introduction to non euclidean geometry covers some introductory topics related to non euclidian geometry including hyperbolic and elliptic geometries this book is organized into three parts encompassing eight chapters the first part provides mathematical proofs of euclid s fifth postulate concerning the extent of a straight line and the theory of parallels the second part describes some problems in hyperbolic geometry such as cases of parallels with and without a common perpendicular this part also deals with horocycles and triangle relations the third part examines single and double
