our economy and future way of life depend on how well american manufacturing managers adapt to the dynamic globally competitive landscape and evolve their firms to keep pace a major challenge is how to structure the firm's environment so that it attains the speed and low cost of high volume flow lines while retaining the flexibility and customization potential of a low volume job shop the book's three parts are organized according to three categories of skills required by managers and engineers basics intuition and synthesis part i reviews traditional operations management techniques and identifies the necessary components of the science of manufacturing part ii presents the core concepts of the book beginning with the structure of the science of manufacturing and a discussion of the systems approach to problem solving other topics include behavioral tendencies of manufacturing plants push and pull production systems the human element in operations management and the relationship between quality and operations chapter conclusions include main points and observations framed as manufacturing laws in part iii the lessons of part i and the laws of part ii are applied to address specific manufacturing management issues in detail the authors compare and contrast common problems including shop floor control long range aggregate planning workforce planning and capacity management a main focus in part iii is to help readers visualize how general concepts in part ii can be applied to specific problems written for both engineering and management students the authors demonstrate the effectiveness of a rule based and data driven approach to operations planning and control they advance an organized framework from which to evaluate management practices and develop useful intuition about manufacturing systems

the assembly of welded reservoirs at the boeing tube duct and reservoir center tdrc is a traditional batch and queue operation that relies heavily on manual craftsmanship the production system experiences high variability in cycle times high use of overtime and poor ontime performance the value provided by the system to boeing and its customers is characterized by considering the associated costs of late delivery inventory labor and opportunity cost to understand the system s performance the system s processes are mapped and modeled using discrete event simulation the simulation is used to evaluate the benefits of changes to staffing overtime implementation and shop floor control based on the results of the simulation lead times are increased to stabilize delivery and a conwip system is implemented to improve productivity and reduce overtime costs subsequent production data show that these changes are effective and that this framework provides successful strategies for value characterization system stabilization cost reduction and increases in value creation
