this book details the process of bringing systems into being beginning with the definition of a need and extending through requirements analysis functional analysis and allocation design synthesis and evaluation and system validation

electro optical and infrared systems are fundamental in the military medical commercial industrial and private sectors systems engineering and analysis of electro optical and infrared systems integrates solid fundamental systems engineering principles methods and techniques with the technical focus of contemporary electro optical and infrared optics imaging and detection

methodologies and systems the book provides a running case study throughout that illustrates concepts and applies topics learned it explores the benefits of a solid systems engineering oriented approach focused on electro optical and infrared systems this book covers fundamental systems engineering principles as applied to optical systems demonstrating how modern day systems engineering methods tools and techniques can help you to optimally develop support and dispose of complex optical systems it introduces contemporary systems development paradigms such as model based systems engineering agile development enterprise architecture methods systems of systems family of systems rapid prototyping and more it focuses on the connection between the high level systems engineering methodologies and detailed optical analytical methods to analyze and understand optical systems performance capabilities organized into three distinct sections the book covers modern fundamental and general systems engineering principles methods and techniques needed throughout an optical system s development lifecycle sdlc optical systems building blocks that provide necessary optical systems analysis methods techniques and technical fundamentals and an integrated case study that unites these two areas it provides enough theory analytical content and technical depth that you will be able to analyze optical systems from both a systems and technical perspective

there has been a lot of innovation in systems engineering and some fundamental advances in the field of optics imaging lasers and photonics that warrant attention this volume focuses on applications tools and techniques of systems engineering related topics from government industrial and academic settings such as development and operations devops agile methods and the concept of the digital twin handbook of systems engineering and analysis of electro optical and infrared systems applications tools and techniques offers more information on the application of decision and risk analysis and statistical methods in systems engineering such as design of experiments dox methods including statistical process control hypothesis testing analysis of variance blocking 2k factorial analysis and regression analysis it includes new material using model based systems engineering and systems architecture methods in a system level design application the integration of recent high speed atmospheric turbulence research results in the optical technical examples and case studies to illustrate the new developments is also included a presentation of new optical technical materials for adaptive optics ao and atmospheric turbulence compensation atc systems that are based on illumination from passive sources natural light or active sources coherent light like from lasers provides the technical focus for the systems engineering methods and techniques chapter 13 focuses on the technical aspects of the design process and uses the systems level design as an illustration in addition to covering lifecycle cost estimation methods and applying them to an integrated case study that is used to illustrate important concepts and techniques throughout this work the final section brings everything together in terms of technical cost and schedule performance because this volume blends modern day systems engineering methods with detailed optical systems analysis and applies these methodologies to eo ir systems this new edition is an excellent text for professionals in stem disciplines that work with optical or infrared systems it s also a great practical reference text for the practicing engineer and a solid educational text for graduate level systems engineering engineering science and technology students

whole system design is increasingly being seen as one of the most cost effective ways to both increase the productivity and reduce the negative environmental impacts of an engineered system a focus on design is critical as the output from this stage of the project locks in most of the economic and environmental performance of the designed system throughout its life which can span from a few years to many decades indeed it is now widely acknowledged that all designers particularly engineers architects and industrial designers need to be able to understand and implement

a whole system design approach this book provides a clear design methodology based on leading efforts in the field and is supported by worked examples that demonstrate how advances in energy materials and water productivity can be achieved through applying an integrated approach to sustainable engineering chapters 1 5 outline the approach and explain how it can be implemented to enhance the established systems engineering framework chapters 6 10 demonstrate through detailed worked examples the application of the approach to industrial pumping systems passenger vehicles electronics and computer systems temperature control of buildings and domestic water systems published with the natural edge project the world federation of engineering organizations unesco and the australian government

automotive systems engineering addresses the system throughout its life cycle including requirement specification design implementation verification and validation of systems modeling simulation testing manufacturing operation and maintenance this book is the first in a series of four volumes on this subject and features 15 papers published between 2004 2010 that emphasize the importance of systems concepts in the automotive area and stress the use of advanced tools and approaches topics covered include technology transfer six sigma deployment systems engineering capability in automotive systems in addition to 11 sae technical papers this volume also includes two invited papers systems engineering definitions by editor subramaniam ganesan and systems engineering for military ground vehicles by m mazzara and r iyer

this book offers a cross civilizational and interdisciplinary approach to the belt and road initiative bri research to mitigate the problematiques of extant literature instead of employing conventional lenses of geo political geo economic and geo strategic analyses that are predominant this book offers fresh perspectives that venture into other civilizational and disciplinary territories while critically seeking integration without falling into romanticizing or essentializing any notions due to epistemic inadequacies and other conceptual limitations of existing approaches this book argues that a heuristic framework drawing from the negotiation between western and chinese perspectives as well as integration of anthropological international relations conceptualizations can provide greater potency in unravelling the intricacies of bri studies this book is a timely contribution to the ameliorating of the rising tensions between us and china over the recent years an interdisciplinary toolkit for researchers in bri related research as well as those in government organizations policy making bodies think tanks trade and industry sectors the book presents a paradigmatic shift from a predominantly hegemonic western thinking about the bri and its role in the region and within academic dialogue
