title of the presentation the effect of radiographic analysis on the process of surgical guide fabrication background precise treatment planning before implant surgery is necessary to identify vital structures to determine the prosthesis design and to ensure a predictable restorative outcome surgical guides are necessary in order to limit the intraoperative inaccuracy of implant placement and preserve the prosthetically driven implant installation the radiographic analysis that comes before plays a role in the process of surgical guide fabrication and the guiding elements that contains taim hypothesis this poster aims to present the way that analytical data affect the fabrication process of a surgical guide depending on the clinical case specific type of surgical guide is needed and indicated materials and methods three techniques of surgical guide fabrication will be presented and compared through 3 clinical cases the first case presents a surgical guide fabricated conventionally with transparent autopolymerizing acrylic resin in a mould of the wax up drilling holes were opened to guide the insertion of two implants in a partially edentulous mandible the second case refers to the fabrication of two surgical guides in a fully edentulous patient which were fabricated by heat polymerizing transparent acrylic resin and barium sulphate teeth drilling holes were opened and 6 implants were placed in the maxilla and 5 in the mandible third case describes the fully guided placement of 4 implants in a

partially edentulous mandible the cbct was exported in a dicom file and the initial cast and the wax up were scanned and transformed to stl files a tooth supported stereolithographic surgical guide was fabricated mguide mis and used until the final drill with an opened flap procedure results the conventional way of fabrication has the benefit of the lower cost and the simplicity of the procedure the guide provides spatial orientation of the implantation sites and relative distances from vital structures but cannot be accurately modified according to the radiographic analysis surgical experience is a prerequisite for its use surgical guides with radiopaque outer surfaces or barium sulfate artificial teeth provide an outline of the planned prosthetic restoration in relation to the anatomic structures evaluation of the emergence profile and the tooth volume allows a more precise orientation of the drilling axis the use of a stereolithographic surgical guide offers accuracy benefits and simplifies the treatment of complex clinical cases combining radiographic clinical and laboratory parameters however it involves a sequence of diagnostic steps that may lead to possible errors higher cost and demanding knowledge of technical issues are some of its drawbacks conclusions and clinical implications radiographic analysis provides clinicians with data that allows thorough understanding of the anatomic conditions in relation to the restorative aspects depending on the diagnostic parameters that are evaluated and the process of surgical guide fabrication the implant installation may be performed with varying precision considering the specifics of a clinical situation the selected type of surgical guide must guarantee the required level of restorative guidance in the surgical field
