recent publications advocate derivative catastrophist interpretations of plate tectonics and uniformitarian interpretations share many premises and conclusions. therefore, a concise analysis of more voluminous evidence for and against uniformitarian plate tectonics can be used as a shortcut to assess the credibility of catastrophic plate tectonics. current ongoing questions regarding uniformitarian plate tectonics offer reasons for skepticism of catastrophic plate tectonics until a more thorough evaluation is complete.

presents the state of current research on the interrelationships between global tectonics and macroscale landscape development across a wide range of topics and study areas. the last 10 years have witnessed a remarkable growth in interest in the relationships between global tectonics and the earth's macroscale topographic features. this new research emphasis has emerged from a range of practitioners within the earth sciences including geophysicists concerned with what can be learnt about tectonic processes from their topographic effects, geologists interested in the factors controlling erosion and the supply of material to sedimentary basins, and geomorphologists wanting to understand the role of tectonics in landscape evolution. various technical developments and new sources of data have also contributed to these developments such as the construction of coupled tectonic surface process numerical models of large-scale landscape development, the creation of large-area high-resolution digital elevation models, and the derivation of long-term denudational records using methods such as thermochronology. this book presents an overview of innovative research in the area and provides directions for future research. each chapter provides up-to-date

surveys of key research questions reports on important current work and highlights outstanding research issues it will be invaluable to those across the earth science community who are interested in the relationships between tectonics and geography
